Momentum equation

9/21/2004

Topic7_NS_F02

3

Consider the moving fluid element model shown in Figure 2.2b

Basis is Newton's 2nd Law which says $\mathbf{F} = m \mathbf{a}$

Note that this is a vector equation.

It can be written in terms of the three cartesian scalar components, the first of which becomes

$$F_x = m a_x$$

Since we are considering a fluid element moving with the fluid, its mass, m , is fixed.

The momentum equation will be obtained by writing expressions for the externally applied force, F_x , on the fluid element and the acceleration, a_x , of the fluid element.

The externally applied forces can be divided into two types:

9/21/2004

Topic7_NS_F02

4

1. Body forces: Distributed throughout the control volume. Therefore, this is proportional to the volume. Examples: gravitational forces, magnetic forces, electrostatic forces.
2. Surface forces: Distributed at the control volume surface. Proportional to the surface area. Examples: forces due to surface and normal stresses. These can be calculated from stress-strain rate relations.

Body force on the fluid element = $f_x \rho \, dx \, dy \, dz$
 where f_x is the body force per unit mass in the x-direction

The shear and normal stresses arise from the deformation of the fluid element as it flows along. The shape as well as the volume of the fluid element could change and the associated normal and tangential stresses give rise to the surface stresses.

The relation between stress and rate of strain in a fluid is known from the type of fluid we are dealing with.

Most of our discussion will relate to Newtonian fluids for which

Stress is proportional to the rate of strain

For non-Newtonian fluids more complex relationships should be used.

Notation: stress τ_{ij} indicates stress acting on a plane perpendicular to the i -direction (x-axis) and the stress acts in the direction, j , (y-axis).

The stresses on the various faces of the fluid element can be written as shown in Figure 2.8. Note the use of Taylor series to write the stress components.

FIG. 2.9 Illustration of (a) shear stress (related to the time rate of change of the shearing deformation) and (b) normal stress (related to the time rate of change of volume).

The normal stresses also has the pressure term.

Net surface force acting in x direction =

$$\begin{aligned}
 & \left[p - \left(p + \frac{\partial p}{\partial x} dx \right) \right] dydz \\
 & + \left[\left(\tau_{xx} + \frac{\partial \tau_{xx}}{\partial x} dx \right) - \tau_{xx} \right] dydz + \left[\left(\tau_{yx} + \frac{\partial \tau_{yx}}{\partial y} dy \right) - \tau_{yx} \right] dx dz \\
 & + \left[\left(\tau_{zx} + \frac{\partial \tau_{zx}}{\partial z} dz \right) - \tau_{zx} \right] dx dy \dots \dots \dots (2.46)
 \end{aligned}$$

$$F_x = \left[-\frac{\partial p}{\partial x} + \frac{\partial \tau_{xx}}{\partial x} + \frac{\partial \tau_{yx}}{\partial y} + \frac{\partial \tau_{zx}}{\partial z} \right] dx dy dz + \rho f_x dx dy dz \dots \dots \dots (2.47)$$

$$m = \rho dx dy dz \dots \dots \dots (2.48)$$

$$a_x = \frac{Du}{Dt} \dots \dots \dots (2.49)$$

$$\rho \frac{Du}{Dt} = -\frac{\partial p}{\partial x} + \frac{\partial \tau_{xx}}{\partial x} + \frac{\partial \tau_{yx}}{\partial y} + \frac{\partial \tau_{zx}}{\partial z} + \rho f_x \dots \dots \dots (2.50a)$$

$$\rho \frac{Dv}{Dt} = -\frac{\partial p}{\partial y} + \frac{\partial \tau_{xy}}{\partial x} + \frac{\partial \tau_{yy}}{\partial y} + \frac{\partial \tau_{zy}}{\partial z} + \rho f_y \dots \dots \dots (2.50b)$$

$$\rho \frac{Dw}{Dt} = -\frac{\partial p}{\partial z} + \frac{\partial \tau_{xz}}{\partial x} + \frac{\partial \tau_{yz}}{\partial y} + \frac{\partial \tau_{zz}}{\partial z} + \rho f_z \dots \dots \dots (2.50c)$$

$$\rho \frac{Du}{Dt} = \rho \frac{\partial u}{\partial t} + \rho \bar{V} \cdot \bar{\nabla} u \dots \dots \dots (2.51)$$

$$\frac{\partial(\rho u)}{\partial t} = \rho \frac{\partial u}{\partial t} + u \frac{\partial \rho}{\partial t}$$

$$\rho \frac{\partial u}{\partial t} = \frac{\partial(\rho u)}{\partial t} - u \frac{\partial \rho}{\partial t} \dots \dots \dots (2.52)$$

$$\rho \bar{V} \cdot \bar{\nabla} u = \nabla \cdot (\rho u \bar{V}) - u \bar{\nabla} \cdot (\rho \bar{V}) \dots \dots \dots (2.53)$$

$$\begin{aligned} \rho \frac{Du}{Dt} &= \frac{\partial(\rho u)}{\partial t} - u \frac{\partial \rho}{\partial t} - u \bar{\nabla} \cdot (\rho \bar{V}) + \bar{\nabla} \cdot (\rho u \bar{V}) \\ &= \frac{\partial(\rho u)}{\partial t} - u \left[\frac{\partial \rho}{\partial t} + \bar{\nabla} \cdot (\rho \bar{V}) \right] + \bar{\nabla} \cdot (\rho u \bar{V}) \dots \dots \dots (2.54) \end{aligned}$$

The term in the brackets is zero (continuity equation)

The above equation simplifies to

$$\rho \frac{Du}{Dt} = \frac{\partial(\rho u)}{\partial t} + \bar{\nabla} \cdot (\rho u \bar{V}) \dots \dots \dots (2.55)$$

Substitute Eq. (2.55) into Eq. (2.50a) shows how the following equations can be obtained.

$$\frac{\partial(\rho u)}{\partial t} + \bar{\nabla} \cdot (\rho u \bar{V}) = -\frac{\partial p}{\partial x} + \frac{\partial \tau_{xx}}{\partial x} + \frac{\partial \tau_{yx}}{\partial y} + \frac{\partial \tau_{zx}}{\partial z} + \rho f_x \dots \dots \dots (2.56a)$$

$$\frac{\partial(\rho v)}{\partial t} + \bar{\nabla} \cdot (\rho v \bar{V}) = -\frac{\partial p}{\partial y} + \frac{\partial \tau_{xy}}{\partial x} + \frac{\partial \tau_{yy}}{\partial y} + \frac{\partial \tau_{zy}}{\partial z} + \rho f_y \dots \dots \dots (2.56b)$$

$$\frac{\partial(\rho w)}{\partial t} + \bar{\nabla} \cdot (\rho w \bar{V}) = -\frac{\partial p}{\partial z} + \frac{\partial \tau_{xz}}{\partial x} + \frac{\partial \tau_{yz}}{\partial y} + \frac{\partial \tau_{zz}}{\partial z} + \rho f_z \dots \dots \dots (2.56c)$$

For Newtonian fluids the stresses can be expressed as follows

$$\tau_{xx} = \lambda(\bar{\nabla} \cdot \bar{V}) + 2\mu \frac{\partial u}{\partial x} \dots\dots\dots(2.57a)$$

$$\tau_{yy} = \lambda(\bar{\nabla} \cdot \bar{V}) + 2\mu \frac{\partial v}{\partial y} \dots\dots\dots(2.57b)$$

$$\tau_{zz} = \lambda(\bar{\nabla} \cdot \bar{V}) + 2\mu \frac{\partial w}{\partial z} \dots\dots\dots(2.57c)$$

$$\tau_{xy} = \tau_{yx} = \mu \left[\frac{\partial v}{\partial x} + \frac{\partial u}{\partial y} \right] \dots\dots\dots(2.57d)$$

$$\tau_{xz} = \tau_{zx} = \mu \left[\frac{\partial u}{\partial z} + \frac{\partial w}{\partial x} \right] \dots\dots\dots(2.57e)$$

$$\tau_{yz} = \tau_{zy} = \mu \left[\frac{\partial w}{\partial y} + \frac{\partial v}{\partial z} \right] \dots\dots\dots(2.57f)$$

The above are the Navier-Stokes equations in “conservation form.”

In the above μ is the coefficient of dynamic viscosity and λ is the second viscosity coefficient.

Stokes hypothesis given below can be used to relate the above two coefficients

$$\lambda = -2/3 \mu$$

The above can be used to get the Navier-Stokes equations in the following familiar form

$$\frac{\partial(\rho u)}{\partial t} + \frac{\partial(\rho u^2)}{\partial x} + \frac{\partial(\rho uv)}{\partial y} + \frac{\partial(\rho uw)}{\partial z} = -\frac{\partial p}{\partial x} + \frac{\partial}{\partial x} \left(\lambda \bar{\nabla} \cdot \bar{V} + 2\mu \frac{\partial u}{\partial x} \right)$$

$$+ \frac{\partial}{\partial y} \left[\mu \left(\frac{\partial v}{\partial x} + \frac{\partial u}{\partial y} \right) \right] + \frac{\partial}{\partial z} \left[\mu \left(\frac{\partial u}{\partial z} + \frac{\partial w}{\partial x} \right) \right] + \rho f_x \dots \dots \dots (2.58a)$$

$$\frac{\partial(\rho v)}{\partial t} + \frac{\partial(\rho v^2)}{\partial y} + \frac{\partial(\rho uv)}{\partial x} + \frac{\partial(\rho vw)}{\partial z} = -\frac{\partial p}{\partial y} + \frac{\partial}{\partial y} \left(\lambda \bar{\nabla} \cdot \bar{V} + 2\mu \frac{\partial v}{\partial y} \right)$$

$$+ \frac{\partial}{\partial x} \left[\mu \left(\frac{\partial v}{\partial x} + \frac{\partial u}{\partial y} \right) \right] + \frac{\partial}{\partial z} \left[\mu \left(\frac{\partial v}{\partial z} + \frac{\partial w}{\partial y} \right) \right] + \rho f_y \dots \dots \dots (2.58b)$$

$$\frac{\partial(\rho w)}{\partial t} + \frac{\partial(\rho w^2)}{\partial z} + \frac{\partial(\rho uw)}{\partial x} + \frac{\partial(\rho vw)}{\partial y} = -\frac{\partial p}{\partial z} + \frac{\partial}{\partial z} \left(\lambda \bar{\nabla} \cdot \bar{V} + 2\mu \frac{\partial w}{\partial z} \right) + \frac{\partial}{\partial y} \left[\mu \left(\frac{\partial w}{\partial y} + \frac{\partial v}{\partial z} \right) \right] + \frac{\partial}{\partial x} \left[\mu \left(\frac{\partial u}{\partial z} + \frac{\partial w}{\partial x} \right) \right] + \rho f_z \dots \dots \dots (2.58c)$$

The energy equation can also be derived in a similar manner.
Read Section 2.7

For a summary of the equations in conservation and non-conservation forms see Anderson, pages 76 and 77.

The above equations can be simplified for inviscid flows by dropping the terms involving viscosity. (read Section 2.8.2)

Navier Stokes Equations

$$\frac{\partial \rho}{\partial t} + \bar{\nabla} \cdot (\rho \bar{V}) \dots \dots \dots (2.55)$$

$$\rho \frac{Du}{Dt} = \rho f_x - \frac{\partial p}{\partial x} + \frac{\partial}{\partial x} \left[\frac{2}{3} \mu \left(2 \frac{\partial u}{\partial x} - \frac{\partial v}{\partial y} - \frac{\partial w}{\partial z} \right) \right] + \frac{\partial}{\partial y} \left[\mu \left(\frac{\partial u}{\partial y} + \frac{\partial v}{\partial x} \right) \right] + \frac{\partial}{\partial z} \left[\mu \left(\frac{\partial w}{\partial x} + \frac{\partial u}{\partial z} \right) \right]$$

$$\rho \frac{Dv}{Dt} = \rho f_y - \frac{\partial p}{\partial y} + \frac{\partial}{\partial x} \left[\mu \left(\frac{\partial v}{\partial x} + \frac{\partial u}{\partial y} \right) \right] + \frac{\partial}{\partial y} \left[\frac{2}{3} \mu \left(2 \frac{\partial v}{\partial y} - \frac{\partial u}{\partial x} - \frac{\partial w}{\partial z} \right) \right] + \frac{\partial}{\partial z} \left[\mu \left(\frac{\partial v}{\partial z} + \frac{\partial w}{\partial y} \right) \right]$$

$$\rho \frac{Dw}{Dt} = \rho f_z - \frac{\partial p}{\partial z} + \frac{\partial}{\partial x} \left[\mu \left(\frac{\partial w}{\partial x} + \frac{\partial u}{\partial z} \right) \right] + \frac{\partial}{\partial y} \left[\mu \left(\frac{\partial v}{\partial z} + \frac{\partial w}{\partial y} \right) \right] + \frac{\partial}{\partial z} \left[\frac{2}{3} \mu \left(2 \frac{\partial w}{\partial z} - \frac{\partial u}{\partial x} - \frac{\partial v}{\partial y} \right) \right]$$
