

Nutrient Uptake & Digestion

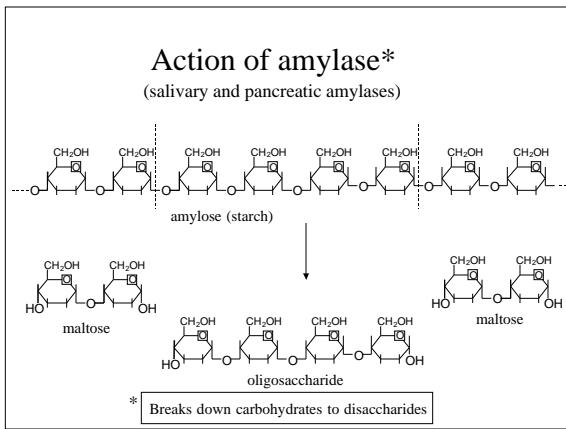

Topics for today:

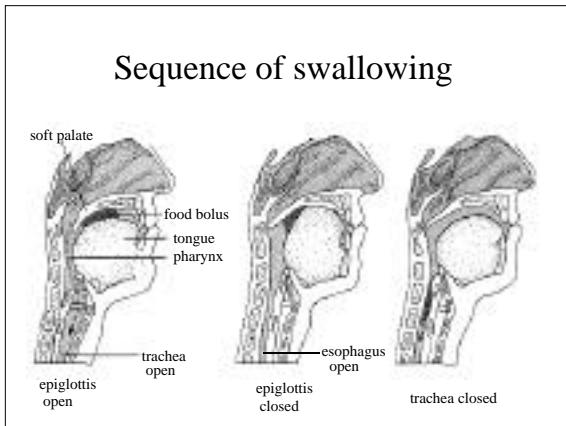

- Overview of energy uptake & digestion
- Amylase digestive action in mouth
- Action of pepsin in stomach
- Role of pancreas in digestion
- Role of duodenum in digestion

Phases of the uptake of energy

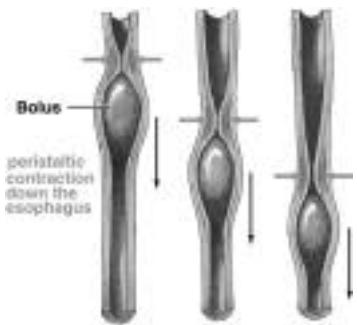

- **Ingestion** - mechanical disaggregation & swallowing of food
- **Digestion** - chemical breakdown of complex to simple nutrients
- **Absorption** - uptake of simple nutrients into blood and lymph

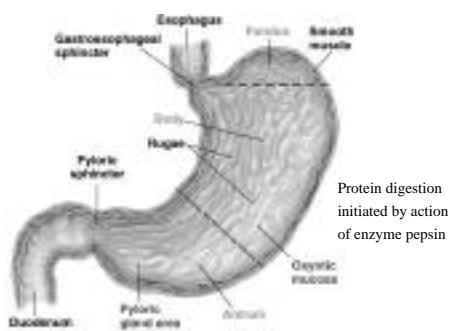

Peristaltic action of esophagus

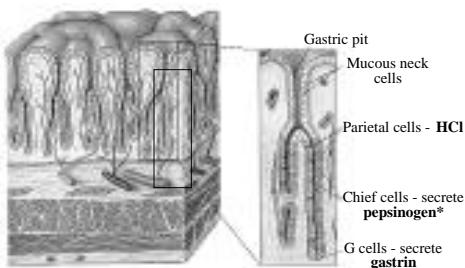

Peristalsis is a traveling wave of contraction of multiunit smooth muscle initiated voluntarily and under involuntary coordination.

Structure of stomach

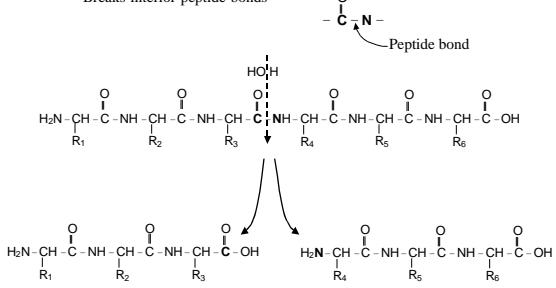

Glands of gastric mucosa

*Precursor of pepsin, a proteolytic enzyme

Pepsin - an endopeptidase enzyme

Breaks interior peptide bonds

Duodenum and Pancreas

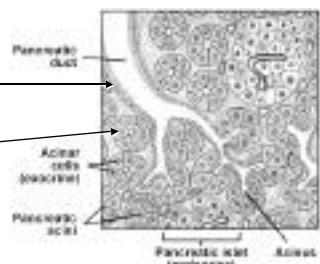

Primary site of digestion

Source of enzymes for digestion of proteins, carbohydrates and lipids

Pancreatic tissue

Secretes HCO_3^-

Source of pancreatic enzymes

Pancreatic fluid components

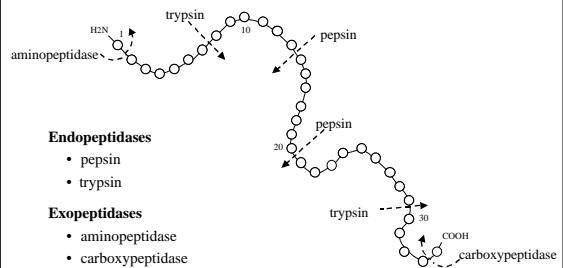

Ductule secretion

- Bicarbonate-rich fluid

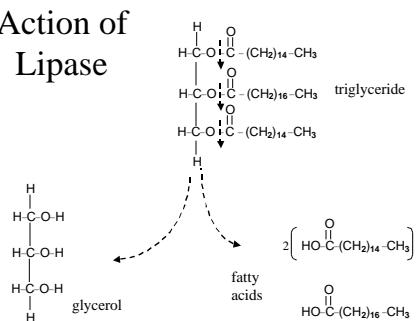

Acinar cell secretion

- Trypsinogen (trypsin precursor)
- Carboxypeptidase
- Amylase
- Lipase

Action of peptidases (proteolytic enzymes)

Action of Lipase

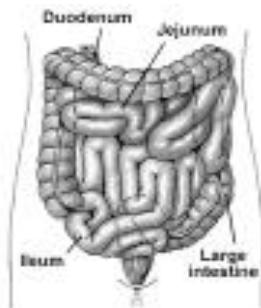

Intestinal tract

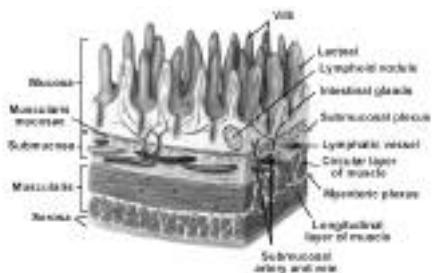

Small intestine

- Duodenum
- Jejunum
- Ileum

Large intestine

Intestinal villi

Secretions into Small Intestine

Duodenal mucosal secretions

- Aminopeptidase
- Maltase
- Sucrase
- Lactase

Liver secretions

- Bile salts (not enzymes)
