

## Particle Work Energy: Example Problem 3

An 80 kg college student jumps off of a 60 m high bungee jump tower. (Treat him as a particle). The unstretched length of the bungee cord is 15 m. He comes to a stop 10 m off of the ground. Please determine:

- The spring constant of the cord;
- The acceleration of the man upward at the moment he stops;
- The location (measured from the top of the tower) at which the man reaches his maximum speed.

**Bungee cord spring constant:  $k = ?$**

**Bungee cord unstretched length:  $L = 15 \text{ m}$**

**Bungee cord spring constant:  $k = ?$**

**Bungee cord unstretched length:  $L = 15 \text{ m}$**
