

Particle Straight Line (Integration): Ex Prob 2

A particle experiences a rapid deceleration: $a = -2v^3 \text{ m/s}^2$.
Initially, at $t = 0$, $v(0) = 8 \text{ m/s}$ and $s(0) = 10 \text{ m}$.
Please determine: **Speed v and position s at $t = 4 \text{ sec}$.**

Discussion: **Acceleration is a function! Of velocity!** So we must match the acceleration function with one of the defining eqns at right.

Our accel function and conditions involve a , v , t and s . **Which defining eqn(s) best fit these?** Answer: **You can use either (1) or (3).**

Defining Eqns

$$\textcircled{1} \quad a = \frac{dv}{dt}$$

$$\textcircled{2} \quad v = \frac{ds}{dt}$$

$$\textcircled{3} \quad a \, ds = v \, dv$$

If you use (3) now, you can integrate to get an equation relating v and s , but you cannot solve for v or s because you do not have a final position (s) or speed (v).

We'll use (1) now. After integration we will have a v vs. t function. At $t = 4 \text{ sec}$ (given), we can find v .

A particle experiences a rapid deceleration: $a = -2v^3 \text{ m/s}^2$.
Initially, at $t = 0$, $v(0) = 8 \text{ m/s}$ and $s(0) = 10 \text{ m}$.
Please determine: **Speed v and position s at $t = 4 \text{ sec}$.**

We'll use (1) now. After integration we will have a v vs. t function....

Defining equation: $a = \frac{dv}{dt} = -2v^3$

Separate variables: $dt = \frac{dv}{-2v^3} = -\frac{1}{2}v^{-3} dv$

Set up integrals and sub in limits from conditions.

$$\int_0^t dt = \int_8^v -\frac{1}{2}v^{-3} dv$$

Defining Eqns

- ① $a = \frac{dv}{dt}$
- ② $v = \frac{ds}{dt}$
- ③ $a ds = v dv$

Set up integrals and sub in limits from conditions.

$$\int_0^t dt = \int_8^v -\frac{1}{2} v^{-3} dv$$

Integrate....

$$t = \frac{1}{4} v^{-2} \Big|_8^v = \frac{1}{4} \left[\frac{1}{v^2} - \frac{1}{64} \right]$$

Re-arrange to get v^2

$$v^2 = \left[\frac{1}{4t + \frac{1}{64}} \right]$$

At $t = 4$ sec...

$$v^2 = \left[\frac{1}{16 + \frac{1}{64}} \right]$$

$$v \approx \frac{1}{4}$$

$$v = 0.25 \text{ m/s}$$

t	v
0	8
1	.5
4	.25

For the second part of this problem, **how would you find the *position, s*, of the particle at $t = 4$ sec ?**

You **now have two equations** to use as starting points....**plus the defining eqns.**

The initial $a(v)$ equation:

$$a = -2v^3 \text{ m/s}^2.$$

or the $v(t)$ equation:

$$v^2 = \left[\frac{1}{4t + \frac{1}{64}} \right]$$

Defining Eqns

- ① $a = \frac{dv}{dt}$
- ② $v = \frac{ds}{dt}$
- ③ $a ds = v dv$

So, which equation can be combined with a defining equation to get position?

Answer: You can use either one! The $a(v)$ eqn with (3) **(easier)**
or the $v(t)$ eqn with (2)...**(harder)**. We'll do both

Hard way: Use the v(t) equation plus defining equation (2)....

We found this v(t) equation....

$$v^2 = \left[\frac{1}{4t + \frac{1}{64}} \right]$$

Solve for v and set equal to ds/dt.....

$$v = \left[\frac{1}{4t + \frac{1}{64}} \right]^{\frac{1}{2}} = \frac{ds}{dt}$$

Separate variables and set up the integral....

$$\int_0^{10} ds = \int_0^t \left[4t + \frac{1}{64} \right]^{-.5} dt$$

The integration is difficult. You must use a table or MathCad or other solver to solve it. Fortunately, there is an easier way....

See the next page....

Easier approach: Use the a(v) eqn plus defining equation (3)....

Defining equation: $a \, ds = v \, dv$

Sub in our function: $(-2v^3) \, ds = v \, dv$

Separate variables: $ds = \frac{v \, dv}{-2v^3} = -\frac{1}{2} v^{-2} \, dv$

Set up integrals and sub in limits from conditions: $\int_{10}^s ds = \int_8^v -\frac{1}{2} v^{-2} \, dv$

Integrate: $s - 10 = \frac{1}{2} v^{-1} \Big|_8^v = \frac{1}{2} \left[\frac{1}{v} - \frac{1}{8} \right]$

Re-arrange:

$$s = 10 + \frac{1}{2} \left[\frac{1}{v} - \frac{1}{8} \right]$$

Easier approach: Use the a(v) eqn plus defining equation (3)....

$$s = 10 + \frac{1}{2} \left[\frac{1}{v} - \frac{1}{8} \right]$$

At v = .25 m/s (found earlier)...

$$s = 10 + \frac{1}{2} \left[4 - \frac{1}{8} \right] = 10 + \frac{1}{2} \left[3.875 \right]$$

$$s = 11.94 \text{ m}$$

At v = .25 m/s...
