

6 Decrease and Conquer

Tuesday, October 8, 2024 11:41 AM

Algorithm Design Technique.

- Exploit the relationship between a large problem and a smaller instance of the problem

• Decrease by 1

○ EG: Power

$$a^n = \underbrace{a \cdot a \cdot a \cdot \dots \cdot a}_{n\text{-times}}$$

How: $a^n \xleftrightarrow{\text{relate?}} a^m$ $m < n$

- $a^n = a \cdot a^{n-1}$
- $a^0 = 1$

FUNCTION $\text{pow}(a, n)$

IF $n = 0$
Return 1

else return $a \otimes \text{pow}(a, n-1)$

top down approach

- What about a bottom up approach?
start at a^0 and build up to a^n

FUNCTION $\text{pow}(a, n)$

$k \leftarrow 0$

$r \leftarrow 1$ // a^0

While $k \leq n$ do

{ $k \leftarrow k+1$

$r \leftarrow r \otimes a$ // $r = a^k$

return r // a^n

Analysis

basic-operation

Analysis

basic-operation

$$M(n) = n \in \Theta(n)$$

Diagram:

• Decrease by a constant factor (2)

$$a^n \xleftrightarrow{\text{relate?}} a^m$$

$$a^n \xleftrightarrow{?} a^{n/2}$$

$$\left[\begin{array}{l} a^n = a^{\lfloor n/2 \rfloor} \cdot a^{\lfloor n/2 \rfloor} \text{ when } n \text{ is even} \\ a^n = a^{\lfloor n/2 \rfloor} \cdot a^{\lfloor n/2 \rfloor} \cdot a \text{ when } n \text{ is odd} \end{array} \right]$$

e.g. $a^6 = a^3 \cdot a^3$
 $a^7 = a^3 \cdot a^3 \cdot a$

```

FUNCTION pow(a, n)
  IF n = 0
    return 1
  ELSE
    b = pow(a, [n/2])
    IF n is even then
      return b * b
    ELSE
      return b * b * a
  
```

Analysis

basic-operation *

using the call tree.

$$\left. \begin{array}{l} \text{pow}(a, n) \\ \quad \downarrow \\ \text{pow}(a, \lfloor n/2 \rfloor) \end{array} \right\} \begin{array}{l} 2 \\ 2 \end{array}$$

$$\begin{array}{l}
 \text{pow}(a, \lfloor \frac{n}{2} \rfloor) \quad 2 \\
 \downarrow \\
 \text{pow}(a, \lfloor \frac{n}{4} \rfloor) \quad 2 \\
 \downarrow \\
 \text{pow}(a, \lfloor \frac{n}{8} \rfloor) \quad 2 \\
 \vdots \\
 \text{pow}(a, 1) \quad 1
 \end{array}
 \left. \vphantom{\begin{array}{l} \text{pow}(a, \lfloor \frac{n}{2} \rfloor) \\ \text{pow}(a, \lfloor \frac{n}{4} \rfloor) \\ \text{pow}(a, \lfloor \frac{n}{8} \rfloor) \\ \vdots \\ \text{pow}(a, 1) \end{array}} \right\} 2 \cdot \log_2 n = M(n) \in \Theta(\log n)$$

eg. a^{100} $\begin{cases} \rightarrow 100 \text{ multiplications} \\ \rightarrow 14 \text{ multiplications} \end{cases}$

○ Diagram:

• Decrease by variable size:

eg. Euclid's Algorithm:

Compute the G.C.D. of two numbers a b

- $\text{GCD}(a, b) \equiv \text{GCD}(a \bmod b, b)$
where $a > b$

- $\text{GCD}(a, a) = a$.

- $\begin{aligned} \text{GCD}(a, b) &\equiv \text{GCD}(a \bmod b, b) \\ &= \text{GCD}(b \bmod (a \bmod b), a \bmod b) \\ &= \text{GCD}((a \bmod b) \bmod (b \bmod (a \bmod b)), b \bmod (a \bmod b)) \\ &\vdots \\ &= 1 \end{aligned}$

$$\begin{aligned}
 & \vdots \\
 & = \text{GCD}(c, c)
 \end{aligned}$$

Pseudocode

```

FUNCTION gcd(a, b) // a ≥ b
  IF a mod b = 0
    Return b
  else
    Return gcd(b, a mod b)
  
```

Trace.

```

gcd(521, 67)
gcd(67, 52)
gcd(52, 15)
gcd(15, 7)
gcd(7, 1)
return 1
  
```

• Decrease by 1

○ EG: Sorting

Intuition.

 size n.

Suppose somebody can solve a smaller problem:

i.e. sort an array of size $n-1$

How can we use that person?

1. use them to sort the array from $[0 \text{ to } n-2]$

Simplest case:

☐ size 1 already sorted

☐ size 2 either swap, or keep.

FUNCTION Insertion Sort ($A[0..n-1]$)

```

for  $i \leftarrow 1$  to  $n-1$  do
     $v \leftarrow A[i]$ 
     $j \leftarrow i-1$ 
    while  $j \geq 0$  and  $A[j] > v$  do
         $A[j+1] \leftarrow A[j]$ 
         $j \leftarrow j-1$ 
     $A[j+1] \leftarrow v$ 

```

note: $A[0..i-1]$ is already sorted.
 $A[i]$: element we are trying to insert.

j : index j searches for a place to insert.

Trace

Trace: • <https://visualgo.net/en>

Analysis: basic-operation

Consider $j: i-1, i-2, i-3, \dots, 0$

$$C(n)_{\text{worst}} = \sum_{i=1}^{n-1} \sum_{j=0}^{i-1} 1 = \sum_{i=1}^{n-1} i = \frac{(n-1)n}{2} \in \Theta(n^2)$$

Think:

- worst-case scenario: array is sorted in reverse order.
- best-case scenario: array is already sorted

$$C_{\text{best}}(n) = \sum_{i=1}^{n-1} 1 = n-1 = \Theta(n)$$
