

# Lecture 1: Course introduction

## Motion in one dimension

- Semester preview
- Motion along a straight line
- Position and displacement
- Velocity and speed
- Acceleration as derivative of velocity with respect to time
- Interpret the sign of velocity and acceleration

# What is physics?

Most fundamental of sciences

Behavior and structure of matter

Galaxy NGC 300, seven million lighters away, constellation Sculptor.

High energy proton collision in the LHC. © CERN

# Why study physics?

- Required for major
- Find out how the world works
- Because it is **FUN**

Demonstrations

# Topic overview

## Mechanics

- Motion of macroscopic objects
- Forces, friction, circular motion
- Energy and momentum
- Motion of planets
- Rotational motion
- Oscillations and waves
- Fluids

## Thermodynamics

[Honda cog ad video](#)

## A few tools:

- SI system of units, unit conversions
- Scientific notation
- Prefixes: micro, milli, centi, kilo...
- Estimates

Please review on your own as needed.  
See Ch. 1, Sec. 1.1-1.6

## Basic math skills\* required in this course

- Linear equations, systems of linear equations
- Quadratic equations
- Basic trigonometry: SOHCAHTOA, Pythagoras
- Calculus 1: derivatives/integrals

**Note:** Calc 1 is a prerequisite for this course. If you have not taken calc 1, you should drop the class.

\*Homework # 1  
will help you review

- Vectors (will be covered in lecture 3)

# Kinematics: Describing Motion

Consider object as point mass → only translation

Things to know about a moving object:

Where is it? → **Position**

How fast is it moving and in which direction?

→ **Velocity**

How do speed and direction of motion change?

→ **Acceleration**

# Position

- In reference to some coordinate system
- numerical value  $x$
- $x(t)$  is location of particle as a function of time
- Initial position:  $x_0 = x(t_0)$  \*

\* Does not mean  $x_0 = 0$

# Showing position

With respect to a coordinate system:

$x$ -axis with origin and a positive direction (arrow)

Mark position at certain times:

# Position versus Time Graphs

# Position versus Time Graphs

# Displacement

Displacement = Change in position: \*

$$\Delta x = x_f - x_i$$

\* **Change** (upper case delta  $\Delta$ ) is the final value of a quantity minus the initial value.

$\Delta x$  can be positive or negative  $\rightarrow$  direction

Displacement is not the same as distance traveled!

# Speed and velocity

“I am currently going at 25 mph”  
= instantaneous speed

Together with information about  
**direction**:

“I am currently going at 25 mph  
North on Pine Street”  
= instantaneous **velocity**

“I drove the 60 miles in one hour”  
= average speed, distance per time

# Average velocity

$$\text{average velocity} = \overline{v_x} = \frac{\text{displacement}}{\text{time interval}} = \frac{\Delta x}{\Delta t}$$

$$\text{unit: } \frac{m}{s}$$

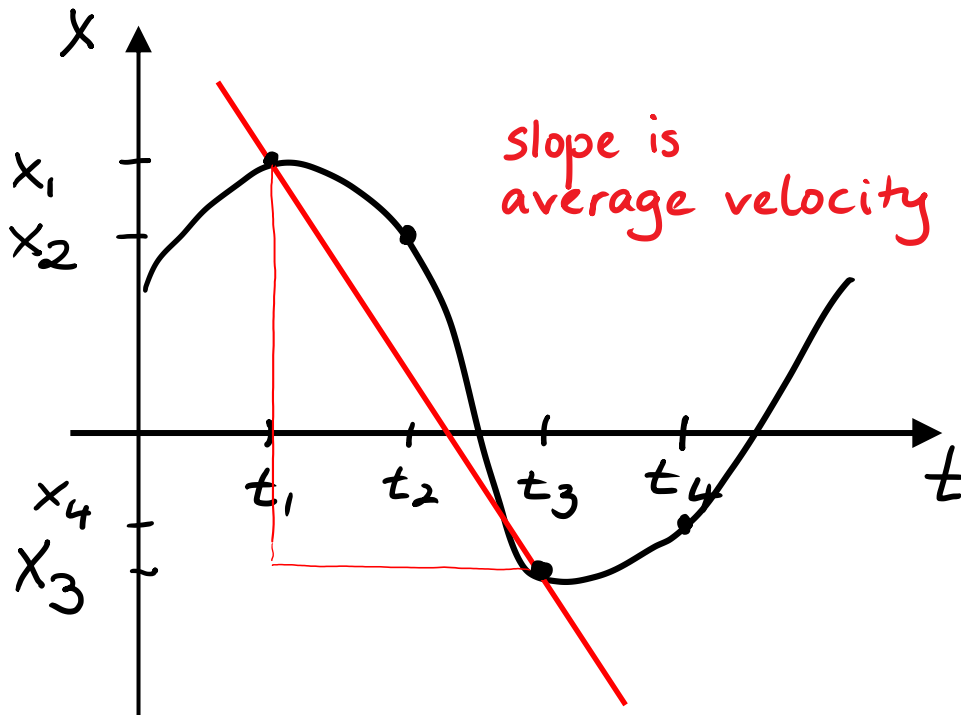

\* The subscript  $x$  is very important!

$\overline{v_x} > 0$  : object moves in the positive  $x$ -direction

$\overline{v_x} < 0$  : object moves in the negative  $x$ -direction

# Average velocity and x-t graph

Average velocity  
between  $t_1$  and  $t_3$ :

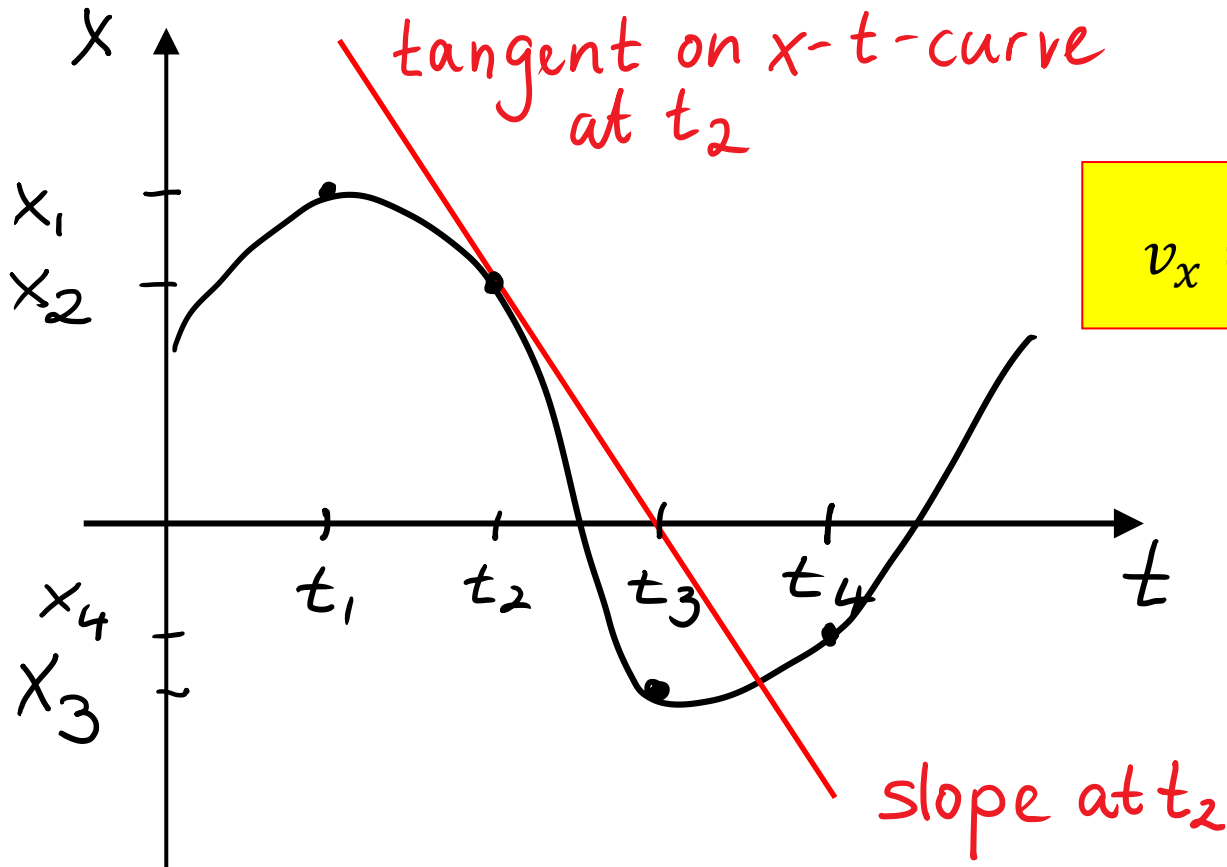

$$\overline{v_x} = v_{av-x} = \frac{x_3 - x_1}{t_3 - t_1}$$

In this example:

$\overline{v_x}$  is **negative**.

Object moves to  
smaller value of  $x$ .

# Instantaneous velocity

$$v_x = \lim_{\Delta t \rightarrow 0} \frac{\Delta x}{\Delta t} = \frac{dx}{dt}$$

$$v_x = \frac{dx}{dt}$$

Speedometer shows  
absolute value  
of instantaneous velocity

$$v = |v_x| = \text{speed}$$

always positive

# Direction of velocity

$v_x > 0$ : object moves in the positive x-direction

$v_x < 0$ : object moves in the negative x-direction

# Acceleration

Acceleration: how fast velocity changes,  
time rate of change of velocity

$$a_x = \frac{dv_x}{dt} = \frac{d^2x}{dt^2}$$

Slope of  $v_x$  vs  $t$  graph

$$\text{Unit: } \frac{m/s}{s} = \frac{m}{s^2}$$

Acceleration produces change in velocity:  $dv_x = a_x dt$

# Signs of acceleration and velocity

If  $a_x > 0$  and thus  $dv_x = a_x dt > 0$ :

if  $v_x > 0$  speed up

if  $v_x < 0$  slow down

# Signs of acceleration and velocity

If  $a_x < 0$  and thus  $dv_x = a_x dt < 0$ :

if  $v_x > 0$ : slow down

if  $v_x < 0$ : speed up

# Motion diagrams

<http://phet.colorado.edu/en/simulation/moving-man>

$$x_0 = 0, v_{0x} = +4 \frac{m}{s}, a_x = -2 m/s^2$$
