

MISSOURI UNIVERSITY OF SCIENCE AND TECHNOLOGY

Chapter 5

Forward and Futures Prices

Math 5737/Econ 5337, Fall 2022

74

MISSOURI UNIVERSITY OF SCIENCE AND TECHNOLOGY

Definition 5.1

- An **investment asset** is an asset which is held by a significant number of people for investment purposes
- A **consumption asset** is held primarily for consumption purposes

Math 5737/Econ 5337, Fall 2022

75

MISSOURI UNIVERSITY OF SCIENCE AND TECHNOLOGY

Remark 5.2

Short selling involves selling an asset that is not owned. The broker borrows the asset from another client and sells it. At some stage the asset must be replaced. Until then, dividends or other benefits must be paid to the owner and a margin account must be maintained.

Math 5737/Econ 5337, Fall 2022

76

MISSOURI UNIVERSITY OF SCIENCE AND TECHNOLOGY

Theorem 5.3

For an investment asset providing no income, we have

$$F_0 = F(0, T) = S_0 e^{rT}$$

and

$$F(t, T) = S(t) e^{r(T-t)}$$

Math 5737/Econ 5337, Fall 2022

77

MISSOURI UNIVERSITY OF SCIENCE AND TECHNOLOGY

Example 5.4

Consider a long forward contract to purchase a non-dividend-paying stock in 3 months. Assume $S_0 = 40$ and $r = 5\%$ cc. Find F_0 .

Math 5737/Econ 5337, Fall 2022

78

MISSOURI UNIVERSITY OF SCIENCE AND TECHNOLOGY

Example 5.5

Suppose the stock price on 1 April 2022 is 10% lower than that on 1 January 2022 and $r = 6\%$. What is the percentage drop of the forward price on 1 April 2022 compared to that on 1 January 2022 for a forward with delivery on 1 October 2022?

Math 5737/Econ 5337, Fall 2022

79

MISSOURI UNIVERSITY OF SCIENCE AND TECHNOLOGY

Theorem 5.6

For an investment asset providing income with present value I , we have

$$F_0 = (S_0 - I)e^{rT}.$$

Math 5197/Econ 5337, Fall 2022

80

MISSOURI UNIVERSITY OF SCIENCE AND TECHNOLOGY

Example 5.7

Consider a 10-month forward on a stock with $S_0=50$, $r=8\%$, that pays dividends of \$0.75 after 3, 6, and 9 months. Find F_0 .

Math 5197/Econ 5337, Fall 2022

81

MISSOURI UNIVERSITY OF SCIENCE AND TECHNOLOGY

Example 5.8

Consider a long 9-month forward to purchase a coupon-bearing bond with current price \$900. The coupon payment is \$40 after 4 months. Suppose the 4-month/9-month risk-free rates are 3%/4%. Find F_0 .

Math 5197/Econ 5337, Fall 2022

82

MISSOURI UNIVERSITY OF SCIENCE AND TECHNOLOGY

Theorem 5.9

For an investment asset providing income continuously at a known yield q (cc), we have

$$F_0 = S_0 e^{(r-q)T}.$$

Math 5197/Econ 5337, Fall 2022

83

MISSOURI UNIVERSITY OF SCIENCE AND TECHNOLOGY

Example 5.10

Consider a forward on a stock paying a continuous dividend at rate 3%, $T=1/2$ year, $S_0=98.34$, $r=10\%$. Find F_0 .

Math 5197/Econ 5337, Fall 2022

84

MISSOURI UNIVERSITY OF SCIENCE AND TECHNOLOGY

Theorem 5.11

The value of a long forward contract at time t is

$$V(t) = [F(t, T) - F(0, T)]e^{-r(T-t)}.$$

Math 5197/Econ 5337, Fall 2022

85

MISSOURI UNIVERSITY OF SCIENCE AND TECHNOLOGY

Corollary 5.12

The value of a long forward on an investment asset providing

- no income is $S(t) - F_0 e^{-r(T-t)}$
- known income with present value I is $S(t) - I(t) - F_0 e^{-r(T-t)}$
- known yield at rate q is $S(t) e^{-q(T-t)} - F_0 e^{-r(T-t)}$.

Math 5197/Econ 5337, Fall 2022

86

MISSOURI UNIVERSITY OF SCIENCE AND TECHNOLOGY

Example 5.13

A long forward contract on a non-dividend-paying stock was entered into some time ago. It currently has 6 months to maturity. The stock price is \$25, the delivery price \$24, $r=0.1$. What is its value now?

Math 5197/Econ 5337, Fall 2022

87

MISSOURI UNIVERSITY OF SCIENCE AND TECHNOLOGY

Remark 5.14

A **stock index** can be viewed as an investment asset paying a dividend yield. Thus, by Theorem 5.9, if q is the average dividend yield on the portfolio represented by the index during the life of a futures contract, then

$$F_0 = S_0 e^{(r-q)T}$$

(otherwise, index arbitrage occurs).

Math 5197/Econ 5337, Fall 2022

88

MISSOURI UNIVERSITY OF SCIENCE AND TECHNOLOGY

Example 5.15

Consider a 3-month futures contract on the S&P 500. Suppose that the stocks underlying the index provide a dividend yield of 1% pa, the current value of the index is 800, and $r=6\%$ cc. Find F_0 .

Math 5197/Econ 5337, Fall 2022

89

MISSOURI UNIVERSITY OF SCIENCE AND TECHNOLOGY

Remark 5.16

A **foreign currency** is analogous to a security providing a dividend yield, which is equal to the foreign interest rate r_f . Thus, if S_0 (in \$) is the spot exchange rate and r is the US interest rate, then the forward or futures price on a foreign currency is

$$F_0 = S_0 e^{(r-r_f)T}$$

(this is also known as the **interest rate parity** relationship from International Finance).

Math 5197/Econ 5337, Fall 2022

90

MISSOURI UNIVERSITY OF SCIENCE AND TECHNOLOGY

Example 5.17

Suppose 2-year interest rates in Australia and the US are 5% and 7%, respectively, cc. Assume $S_0=0.62$ USD per AUD. Find F_0 .

Math 5197/Econ 5337, Fall 2022

91

MISSOURI UNIVERSITY OF SCIENCE AND TECHNOLOGY

Remark 5.18

Storage costs can be treated as negative income with present value U or negative yield u . Hence, for commodities that are investment assets, we have

$$F_0 = (S_0 + U)e^{rT} \text{ or } F_0 = S_0 e^{(r+u)T}.$$

Math 5733/Econ 5333, Fall 2022

92

MISSOURI UNIVERSITY OF SCIENCE AND TECHNOLOGY

Example 5.19

Consider a 1-year futures on an investment asset providing no income, but it costs \$2 (at the end of the year) to store the asset. Assume $S_0 = 450$ and $r = 7\%$ cc. Find F_0 .

Math 5733/Econ 5333, Fall 2022
