

MISSOURI UNIVERSITY OF SCIENCE AND TECHNOLOGY

Chapter 2

Probability

- 2.1 Sample Spaces and Events
- 2.2 Axioms, Interpretations, and Properties of Probability
- 2.3 Counting Techniques
- 2.4 Conditional Probability
- 2.5 Independence

Experiments

- An **experiment** is any action or process whose **outcome** is subject to uncertainty.
- The **sample space** of an experiment is the set of all possible outcomes of that experiment.
- An **event** is any subset of outcomes contained in the sample space.
- An event is **simple** if it consists of exactly one outcome and **compound** otherwise.

Example

Consider the following experiment: Roll a die.

Find the **sample space** of this experiment and **specify/classify** the following **events**:

- a) It's a "3" (event A)
- b) It's a "4" or a "5" (event B)
- c) It's an even number (event C)
- d) It's at least "4" (event D)
- e) It's between "2" and "4", each included (event E)

45

MISSOURI UNIVERSITY OF SCIENCE AND TECHNOLOGY

Example

Consider the following experiment: Pick a random number between 0 and 1.

Find the **sample space** of this experiment and **specify/classify** the following **events**:

- a) It's less than a half (event A)
- b) It's less than or equal to three quarters (event B)
- c) It's a half (event C)
- d) It's between one quarter and three quarters, each included (event D)

Relations from Set Theory

- The **complement** of an event is the set of all outcomes in the sample space that are not contained in that event.
- The **union** of two events is the set of all outcomes that are either in one of these two sets or in both.
- The **intersection** of two events is the set of all outcomes that are in both of the events.
- Two events with empty intersection are called **mutually exclusive** or **disjoint**.

Example

For the discrete (die) example, find the following events:

A' , B' , C' , $A \cup B$, $A \cup C$, $B \cup C$, $A \cup (B \cap C)$, $B \cap C$, $B \cap D$, $C \cap D$,
 $A \cap B$, $C \cap (B \cap D)$, $(C \cap D) \cap B$, $A \cup (B \cap C)$, $(A \cup B) \cap (A \cup C)$,
 $D \cap (B \cup C)$, $(D \cap B) \cup (D \cap C)$, $(B \cup C)'$, $B' \cap C'$, $(B \cap C)'$, $B' \cup C'$.

For the continuous (random number) example, find the following events:

$A \cup B$, $A \cup C$, A' , C' , $A \cap B$, $A \cap D$, $(A \cap D)'$, D' , $A' \cup D'$.
