- Associate editor for the Journal of Geophysical Research-Solid Earth, 1/2017-12/2021.

### **RESEARCH ACTIVITIES**

My research includes two major areas:

The primary research of my research is to image the internal structure of the Earth, aiming to understand its dynamic processes and the mechanisms behind geohazards such as earthquakes and volcanoes. My specific interests lie in several key subdomains of solid-earth geophysics, including the seismic anisotropy of the Earth's crust and mantle, as well as the stratified composition of the Earth's interior. Together with other researchers in geophysics at S&T, we have established the first uniform shear wave splitting parameter database for North America.

The second research area is utilizing seismic data to image subsurface structure to understand depositional environment and hydrocarbon potential. Seismic attributes associated with time, amplitude, frequency, and attenuation are extracted and integrated with petrophysical information for oil and gas reservoir characterization and property mapping.
